

Brow Suspension Operation with Fascia Lata in Congenital Ptosis (A Case Report)

[Pak J Ophthalmol](#) Jul 2003;19(3):90-2.

Eye Department, CMH Peshawar Cantt

Congenital ptosis, whether unilateral or bilateral, is a cause of cosmetic disfiguration and is treated with various methods. Severe congenital ptosis is usually treated by brow suspension operation with fascia lata. It gives consistently better cosmetic and functional results. The medical literature in Pakistani journals is very little on this subject. A case of severe congenital ptosis is being reported which was surgically treated with fascia lata frontalis sling.
